[ Scybernethics & Tekhne: Simondon, Relational Realism and the Limit of Formalism/Ontology ]

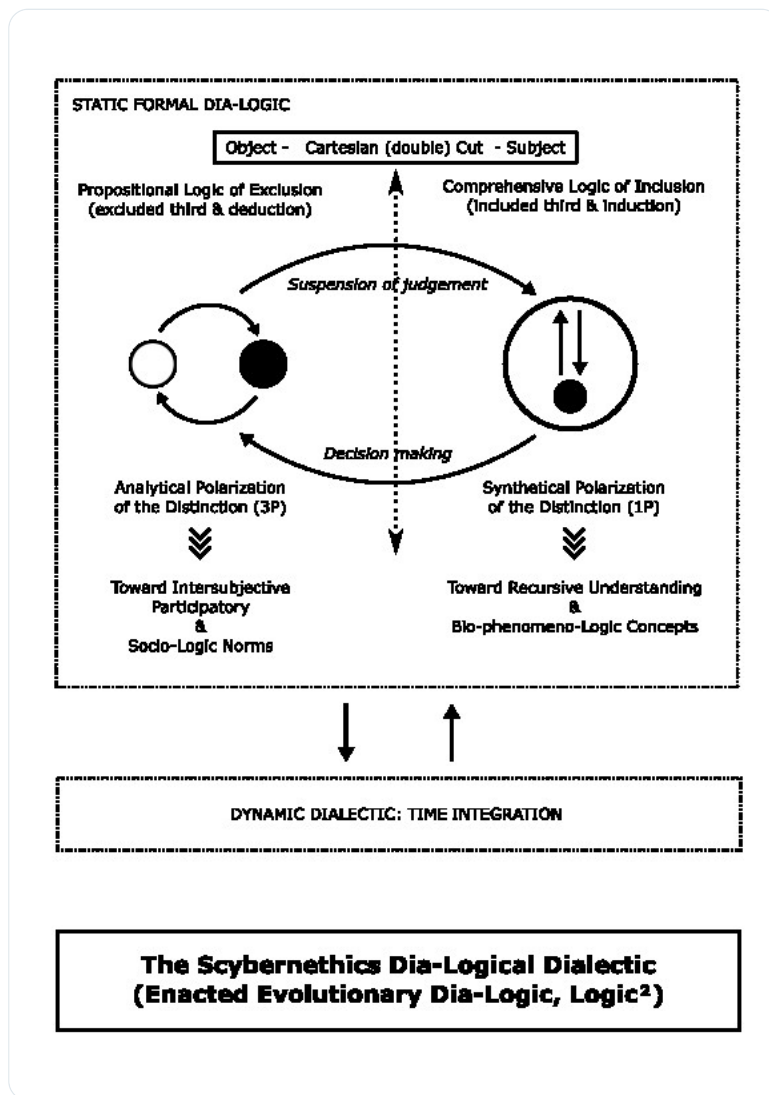

After being driven by the enactive framework, I have converged (through Stiegler) toward Simondon. But his technical, and so transjective conception confusing the 1PP and the 3PP,

seems to lead to a relational realism ground I have de-constructed in my enactive 1P-{1P-3P} "toward a meshwork of groundless grounds" polarized (self)understanding.

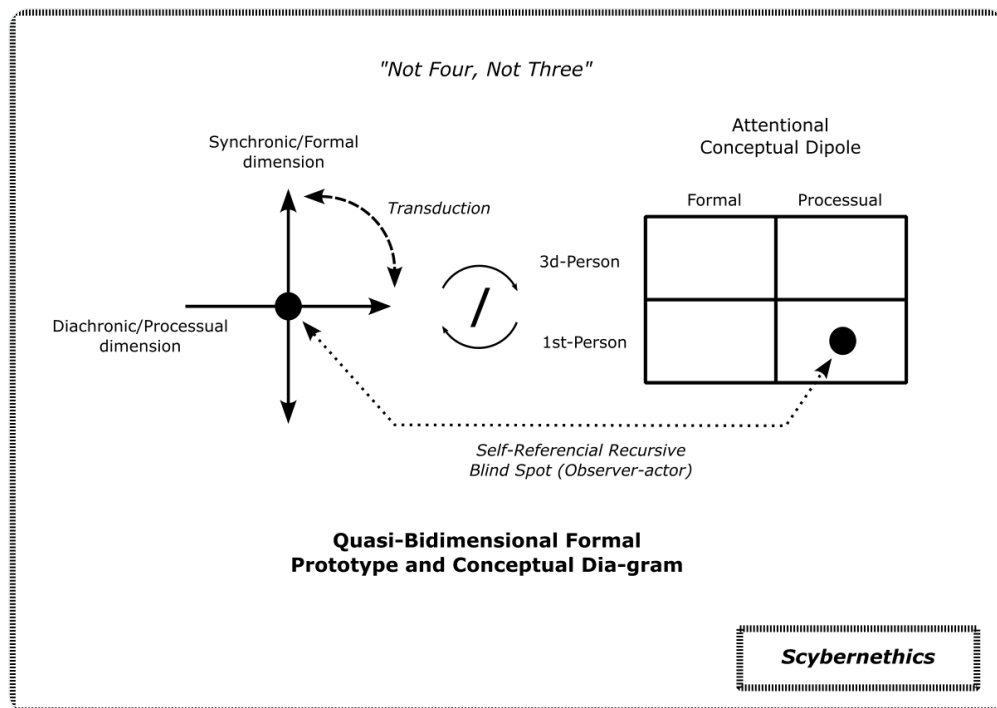

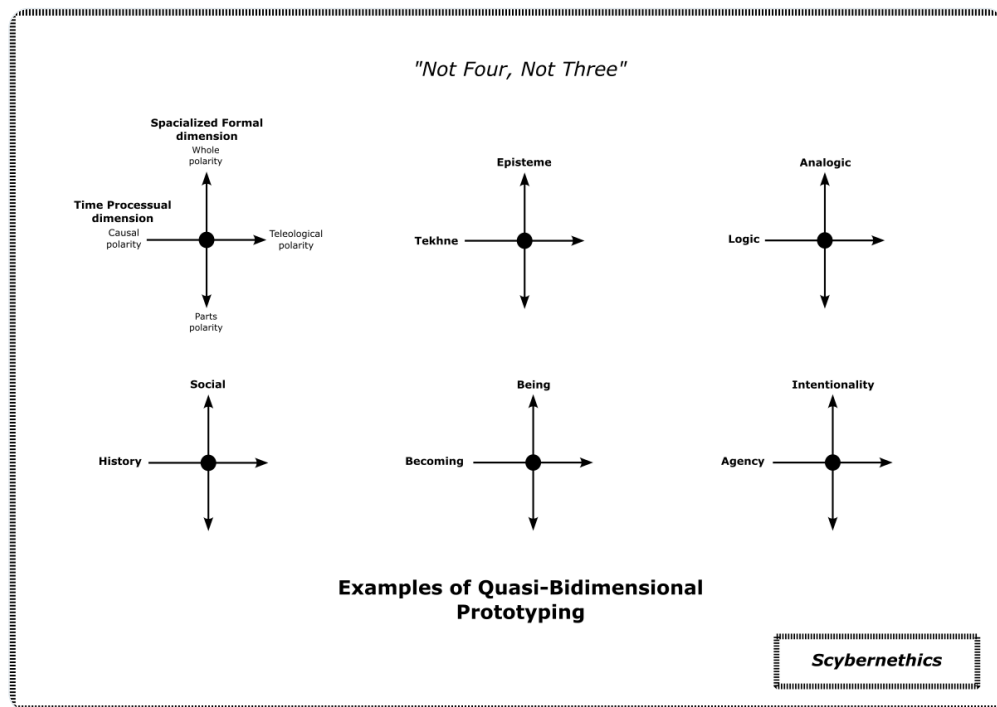

His conception is clearly useful to better understand the/our technicity (a current blind spot of Science),

but needs for me, ethically, to be also faced with an analytical 1P-3P epistemic logic (phenomenology + sciences of cognition), so that to produce a \*meaningful and transformative tension\* of (self)intelligibility ( img 1).

This doesn't contradict his conceptual expression, but relativize and extend it as enacted. It is more explicit in my own different/differAnt conception of what is a "transduction":

a jump between the \*formally irreducible\* two dimensions of the phenomenological quasi-bidimensionality (dimenTionality, form/process) of consciousness (👉img 2 and 3).

The processual can only be understood and rendered collectively intelligible as a dimension enacting the form. This is the inherent recursivity of any (onto)epistemological act of trying to know formally consciousness, and so it's objective scientific formal \*limit\*.

Only meditative practices, eventually guided by more and more refined conceptual understanding (through experience and tradition), can go beyond this frontier, can converge infinitely toward this phenomenological self-referential emancipatory horizon.
